

Table 1. The timeline of the evolutionary development of the universe (Evol) of 13.8 billion years is (in reverse) projected onto the timeline of 7500 years from the creation story (Creat) (E>C), where $y(\text{total}) = \text{Evol} / 10^6$. What you immediately notice is, that this results in an interval $y(7500) = y(\text{total}) / 10^6$ of approx. 6 days for the remaining 7500 years, with $\text{days} = (y(7500) \times 365,25) + 1$. Thus as, in terms of numerical values and in reverse, the evolutionary line $y(\text{total})$ could now be considered the historical timeline (Creat), the remaining timeline (days) considered the timeframe of creation (0).

<i>Evol</i>	<i>Creat</i>	<i>E>C</i>		
		<i>y(total)</i>	<i>y(7500)</i>	<i>days</i>
13 800 000 000	0	13 800	0,014	6,0
